

DGS

Automatically feed and screw in coil thread inserts

Based on a proven series of automatic screwdriving systems from STÖGER AUTOMATION, an automatic screwdriver has been developed to feed and screw in coil thread inserts automatically as bulk material. Designed especially for serial production, it's used wherever high cycles times and process reliability are needed. The integrated over stroke also enables screwing onto hard-to-reach screw locations with interfering edges. Fasteners are fed through a flexible hose, thus magazines or strips are not needed. This enables the screwdriving unit to be operated in locations that are difficult to reach, as well. Plus, feeding the coil thread inserts as bulk material significantly reduces costs. The DGS also offers the advantage of being able to process coil thread

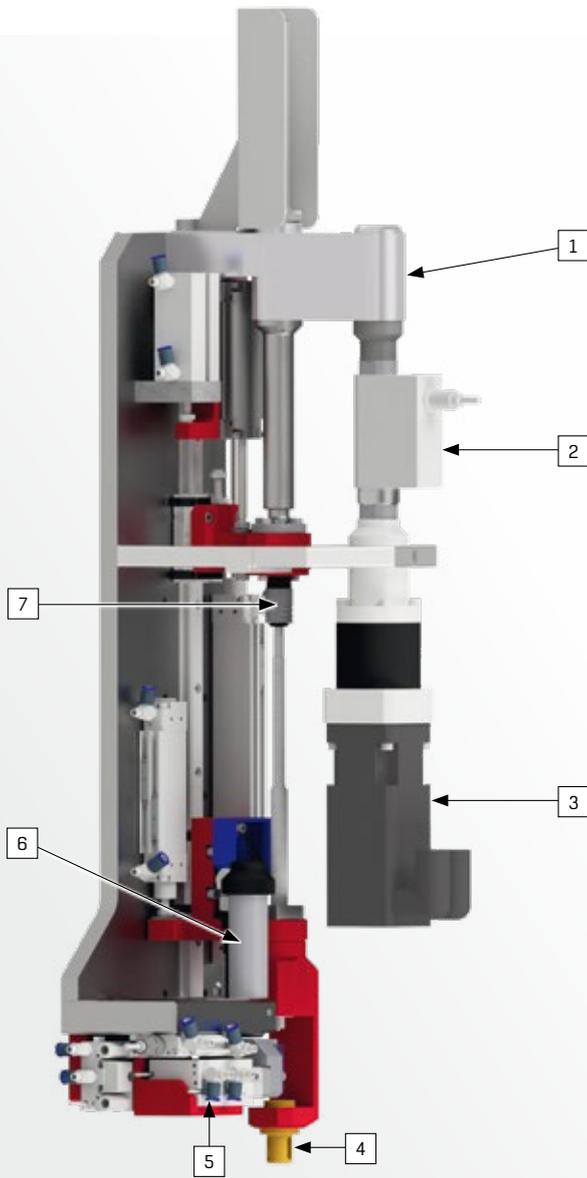

inserts independent of position, and it can be used in robotic systems and on positioning axes, too.

THE ADVANTAGES AT A GLANCE:

- + *Developed for serial production*
- + *High cycles times possible*
- + *Integrated over stroke for screwing onto screw locations with interfering edges*
- + *Highly reliable by monitoring torque, torque angle and screwdriving depth*
- + *Automatic feed of fastening elements is low-cost as bulk material*
- + *Easy maintenance due to quick couplings for tool change*
- + *Integrated system: screwdriver with automatic feed unit and controller*

Modules

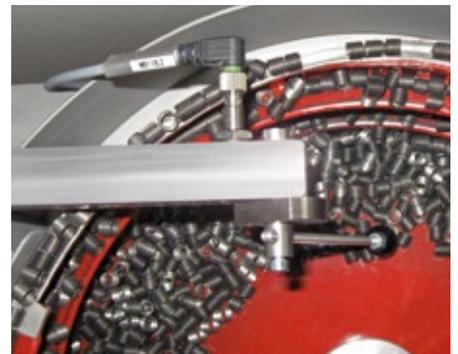

- 1 Toothed belt drive
- 2 Torque transducer
- 3 Servo motor
- 4 Support for level-based fastening
- 5 Loading device with clamp jaws
- 6 Hose connection
- 7 Quick fastener

Dimensions and weight

Length	approx. 800 mm
Width	200 mm
Depth	220 mm
Weight	15 kg

Example of a feeding unit

Types

- With conical tip
- Sizes M4-M14
- Further sizes on demand

- Without pin and two conical tips
- Sizes M4-M14
- Further sizes on demand
